Los Angeles, CA · remote-ready

OBSCURA VPN · SENIOR DESIGN ENGINEER · REMOTE (AMERICAS / EUROPE)

Hi,

I saw the Design Engineer role, and the line about coding up reimagined product experiences while caring for every part, from copy to animation to business impact. That end-to-end lane, where I design the product and ship the front end myself, is exactly how I work.

The opinion I would bring is one I paid for. I trusted AI to build a couple of products end to end, shipped them, and nobody used them. The models are very good at producing something plausible. They have no idea when the thing should not exist. So I move fast with them and keep the judgment, which is the instinct a small founder-led team needs to ship quickly without lowering the bar.

At Warp, a Series A startup where I reported directly to the founders, I designed an agentic freight platform end to end and took it to a shipped product in React and TypeScript, working AI-first. I also built our design system, Lumen, on my own, so a growing product could add new surfaces without drifting. That design-it-and-ship-it work, holding a growing system together, is the closest thing on my résumé to what this role is.

Obscura's whole bet, a VPN that is actually private rather than just promised to be, is the kind of product I would want to sweat every detail on. The interesting problem in privacy tooling is making something secure also feel effortless to use, which is a design and a front-end problem at the same time.

I am strong in React, TypeScript, and Figma, and I would be picking up Rive on the way in. I am in Los Angeles, remote-ready, and can start immediately.
